Collet TIR

Collet Class	Max. TIR
SX	0.00020" @ 4D
SX-P	0.00012" @ 4D

Reduced Harmonic Design

When gage-lines are aligned, SX16 sits deeper in the chuck with less overhang and more shank support than ER32.

The Flat Locking Surface eliminates any influence from the locking nut for consistency on every tool change.

3 Micron Provides Results

Shown below a 1/4" at 10X. Worst Case Runout Shown with each collet at maximum TIR.

High Pressure Coolant Caps

SX Coolant Caps supply up to 1,000 psi coolant seal. The threaded cap design when properly tightened has no effect on the TIR of the assembly, even at 30D!

Jet-Blast also available for solid cutting tools.

SX25 Non-Pull Out Collets

For Hi-Feed Milling Applications

Non Pull out collets are developed for hi-feed titanium and aluminum applications with a cutter helix of 45° or greater to prevent cutter pull out.

The Pioneer design utilizes a standard hardened 62Rc 3mm dowel pin to provide contact across the flat and superior sheer strength.

The preset screw is used to hold the cutter in position, preventing any movement while being locked into the tool holder.

The modification is performed at our location in Chicago, the pin location can be adjusted to fit any flat or groove position within the collet bore behind the nut. Special configurations available upon request.

SX25 Non-Pull Out Assembly - How does it work!

Insert SX25-NP Collet into the SXN25M Nut

Insert cutting tool into the collet, cutter flat orientation to the pin hole as shown

Use safety gloves if required

Fully insert cutter into the collet

Insert Pin into the Pin Hole
Note: if cutting tool flat is not in the correct orientation the pin will not insert, rotate cutter if needed to align the pin to the flat

Once the pin is fully inserted pull out on the cutting tool so the back of the flat is tight against the pin
Use safety gloves if required

Insert the preset screw finger tight against the back of the cutting tool to hold the cutter in place and eliminate gap and movement

Assemble into the collet chuck, torque to 85 ft/lbs, you are ready to go!

MX & VX 3 Micron Chuck

Clamping Range : 0.125" - 0.500"

ISO h6 Tool Shanks Required

Simply the Best Finish & Tool Life in a Cost Effective Milling System

Hands Down Winner in any Finish Milling Application!

Designed for Finish Milling

Once you pre-load the collet into the VX holder, repeatability is less than 0.0001" Tool to Tool due to the cross pin design which prevents twisting on the collet while tightening.

When you "have to" use Extensions

No one wants to use extensions but when you have to, use an extension that has the Best TIR in the industry.

Guaranteed 3µm @ 4D, no extension runs better.

Coolant Thru for High Pressure with a Jet-Blast option for solid tools.

Reduced Harmonic Design

Unlike materials, taper nose and draw bar design provide superior vibration dampening over Slim Nose Shrink holders and extensions.

Compact Design

The MX and VX system are compact to provide maximum nose clearance for hard to reach applications.

We have redesigned the nose ends for additional clearance:

VX06 = 0.500 (Previously 0.625)

VX08 = 0.787 (Previously 0.870)

VX12 = 1.000 (Previously 1.180)

Unbeatable T.I.R. - 3µm @ 4D or better!

Collet TIR

Collet Class	Max. TIR
MX	0.00012" @ 4D

Coolant Thru for High Pressure or Jet-Blast

Collets are sealed by design for high pressure coolant or air. Jet-Blast is available for coolant around solid tools.

How MX Works

Coolant thru center draw bolt accessed from the retention knob end of the holder draws the collet into the pocket and tightens the collet. Please note the retention knob must have a 6mm or larger coolant hole for the 5mm wrench to clear or the knob will have to be removed to change cutting tools.

Design uses a T-Handle Hex wrench to tighten which limits the maximum gripping force, MX is designed for finishing only.

How VX Works

VX is a front locking collar design utilizing a pin spanner wrench to tighten. This allows for increased locking pressure over MX up to 5X the holding power.

The front locking mechanism requires the collet to be threaded into the holder before the collar can be locked.

VX Assembly & Tightening Instructions

The instructions below are a basic procedure. Always use proper safety equipment when working with any machine tool component.

Turn locking collar counter-clockwise until it stops.

Insert collet and turn clockwise. Use Flat Screw Driver if required.

Turn collet until it stops or reaches 1/8" from the face of the chuck. Assemble loose, **Do not tighten!** Thread gap is required for proper function.

Insert cutter, while holding the cutter hand tighten the locking collar clockwise until the collet holds the tool.

Tighten locking collar to 30 ft/lbs Maximum. Do not over tighten or tool can jam or cause excessive TIR!

Bearing transfers torque more efficiently with ER collets allowing higher grip forces without increasing locking torque.

For best performance use ER collets with our bearing nuts!

ER32 standard nut locked at 100 ft/lbs using a 1/2" carbide test arbor, the arbor slips at 60 ft/lbs of radial torque, using a Pioneer Bearing Nut the arbor slipped at 130 ft/lbs of radial torque. The average improvement on ER16 thru ER40 was 75% to 125% increase in radial holding power.

Note: Cutter size, material and finish may effect results. Recommend on-size collets when available.

Did your cutter company supply a coolant screw?

Use our standard holder for coolant through the modified screw - or - use our FX model for additional coolant flow!

4 Ports allow a little back pressure if your machine uses a High Volume Pull Stud.

Note: The standard model is designed for non-coolant and coolant screw applications. For ported cutters, coolant holes to the insert from the pilot of the holder, the FX model is required.

FX Coolant Port System

- Designed for cutter bodies with coolant ports to each insert from the mounting pilot.
- 500%+ Increase in coolant volume for faster chip evacuation in high feed milling applications over modified screws.

Note: Some cutter manufacturer's supply a modified cutter mounting screw with coolant ports. Use that screw in concert with the **FX Coolant System** for increased coolant volume.

Pioneer Quick Change Tapping Options

Pioneer offers Rigid, Length Compensating and Tap ER for fully Synchronized tapping applications. Our adapters are manufactured by the company who invented the system so there is never a compatibility problem.

What holder should I use?

In CNC applications where the hole is being drilled in the same setup, it comes down to the machine tool to determine which holder is best for you.

Rigid Tapping

When rigid tapping in a fully synchronized system ER Tap collets provide zero movement with no axial play. While Quick Change RT & RA are called “rigid” they still have some movement in the Quick Change connection which can cause some issues.

RT holders do have a hole thru the center for coolant, it is not sealed but works well with the appropriate adapter. Most RA adapters allow coolant to the back of the tap, the exception is some of the pipe adapters have a stop plug that needs to be modified. This is not a sealed system but fluid dynamics apply, if the outlet coolant hole is larger than the inlet coolant hole there is no issue. Leakage occurs when the outlet coolant hole is smaller than the inlet causing back pressure. This back pressure will leak out of the mechanism.

Roll Form

It is recommended to use ER Tap Collets for Roll Form Tapping. Quick change does not perform well with Roll Form applications.

Length Compensating

In applications where there is backlash in the machine or timing to pitch issues, Tension and Compression holders will compensate to allow the tap to cut freely without pressure from the machine tool. Programming should be 95-98% of Pitch of in-feed, 100% of Pitch on reverse. This will allow the tap to pull out on the springs of the holder while tapping the hole and spring back when exiting the hole to prevent thread pulling and double cutting.

Rigid Adapters vs Torque Control

Torque control adapters have a user adjustable clutch. The clutch is set for mild steel from the factory. Torque control adapters will clutch if there is hard spots in the material, the drilled hole is not deep enough or the tap has become dull and is not cutting properly. Due to the sensitivity of the clutch the adapter will clutch before the tap is fully dull.

In CNC machine tools we recommend RA Rigid Adapters with TC Tension and Compression holders due to the drilled hole being controlled by the same setup. However there is always a chance of tap breakage if the tap becomes too dull in a RA Adapter.

Precision Sync ER Tapping System

Reduce Tap Wear and Extend your Tap Life

- Compensates for synchronization errors in the tap cycle
- Minimal length compensation in both Tension and Compression compensates for small pitch differences between the spindle and tap reducing friction on the tap flanks
- Increases tap life at least 30%
- For tapping speeds up to 15,000 RPM's
- For use in Left or Right hand applications
- Coolant Thru, for use up to 1,500 PSI
- Compact Design with Modular Shank options to fit many machine spindles

Coolant Thru Tapping with Precision Sync

The holder is designed for coolant thru the center. To see the tap shank use a coolant cap matching the tap shank size to create the seal.

Required (each sold separately)

- Holder
- Coolant Cap Nut (page 28)
- Coolant Cap (page 28-29)
- Tap Collet (page 26-27)

Please note the coolant tap shank must be long enough for the coolant deal to make contact on the full round diameter, tap flutes cannot enter the cap.

ER Collets

Optimize your work in many ways:

Pioneer has updated our collet offering to meet the high demands of precision cutting tools and high performance applications.

ER collets are now offered in standard, sealed by design and tap collets.

- Pioneer standard collets come in General Purpose and new RPC Ultra Precision.
Pioneer Sealed collets are sealed by alternating slots. The cutting tool shank must make full contact with the collet bore to create a seal. This design allows for the highest coolant pressures without damage to the collet.
- Pioneer Tap Collets are available in ANSI and DIN configurations with a square punched into the ID for positive drive.

RPC—Rust Preventative Coated Precision Collets

Pioneer RPC Collets are only available in a 5 micron (0.0002") TIR @ 3D and 2 micron (0.00008") TIR @ 3D.

The picture to the right is a standard ER collet and a RPC collet that were submerged in Chicago tap water for 3 months. The stainless collet showed no corrosion anywhere compared to the standard collet.

Available in ER08-ER40 in select sizes.

Jet-Blast ER Coolant Collets

Features:

- High Pressure Coolant - 1,500 PSI
- Standard .0004" T.I.R.
- Designed for h6 Tool Shanks
- Add J to any SSER collet part number

Coolant thru standard collet slots create a loss in pressure and flow control, allowing coolant to fly everywhere. The **Jet-Blast** option for SSER forces the coolant into the **Jet-Blast Ports** maintaining pressure and directing the coolant down the flutes of the cutting tool.

ER Rigid Tap Collets - ANSI

Features

Special design locks tap flats into the collet slots preventing the tap from spinning inside the collet.

- ANSI Shank and Square Standard

Note:

Due to Multiple Standards for Metric Taps, the actual shank and square must be supplied to verify compatibility.

ER Collet Nuts

Pioneer replacement ER nuts exceed industry standard for fit, finish and balance. ER nuts are in 4 styles, Mini, Hex, E Type & RD Type.

- Hex Nuts** are standard for ER11, ER16 & ER20. Smaller diameter than E-Type with standard chuck threads. Hex nuts are machined with an eccentric for easy collet installation and removal.
- E-Type** or castle type use the 4 prong wrench or spanner wrench, standard on ER25, ER32 & ER40. E-Type nuts are machined with an eccentric for easy collet installation and removal.
- EXT** are external threaded nuts for stub length holders. Due to the constraints of the design collets must be “snapped” into the nut. Tap and Sealed Collets are difficult to install and remove.
- Mini nuts** are designed for reduced threaded Mini Chucks. Mini nuts use a special E type wrench. Mini's are not interchangeable with Hex or E-Type. Mini nuts are a compression type nut, must be pressed onto the collet for the nut to extract the collet from the chuck.

Note: Mini Nuts do not function well with some sealed and tap collets due to the limited space to tip the collet for removal. Some small ID, tap and sealed collets are difficult to compress causing issues in installation and removal.

Note: ER Nuts are built to DIN standards. Per DIN tolerances the collet may or many not be retained by an eccentric style nut. If the collet is not retained into an eccentric style nut are not defective but a result of the DIN tolerances.

MC Coolant Cap Sealing System

for MC Collets & MC Chucks

Pioneer Coolant Cap Seals create a positive seal against the face of the Mill Chuck body and the shank of the cutting tool. The system utilizes a standard MC collet, a coolant cap that matches the collet ID, and a coolant cap nut.

- **Low Cost** - Uses standard MC collets
- **Replaceable Seals** - Utilizes standard O-rings for easy low cost replacement
- Works with all MC Collets and MC Chucks Only

High Performance Bearing Nuts

**Double your grip force
without increasing your locking pressure.**

Bearing transfers torque more efficiently with ER collets allowing higher grip forces without increasing locking torque.

For best performance use ER collets with our bearing nuts!

ER32 standard nut locked at 100 ft/lbs using a 1/2" carbide test arbor, the arbor slips at 60 ft/lbs of radial torque, using a Pioneer Bearing Nut the arbor slipped at 130 ft/lbs of radial torque. The average improvement on ER16 thru ER40 was 75% to 125% increase in radial holding power.

Note: Cutter size, material and finish may effect results. Recommend on-size collets when available.

- Coolant flow from a modified screw does not feed full volume to the inserts
- Modifying the screw weakens the screw causing damage to the cutter and machine tool

Retention Knob Tightening Torque

To avoid any warranty and safety issues always use the machine tool manufacturer's specifications.

Traditional locking torque for Retention Knobs are as follows:

- 30 Taper = 35-40 ft/lbs
- 40 Taper = 75-85 ft/lbs
- 50 Taper = 100-110 ft/lbs

Depending on the material, heat treat and wall thickness of the tool holder the above torque specifications can expand the tool holder taper at the small end causing uneven spindle wear and cutting tool runout. Many companies have started using a lighter torque number to reduce or eliminate the expansion. Many machine tool manufacturers do not recommend this lighter system. **Check with your machine tool manufacturer for recommending operational torque.**

Torque Wrench

Recommended settings to be 10% below maximum torque to prevent over tightening.

Note: It is recommended to calibrate the wrench to manufacturer's specifications and re-calibrate as recommended. Over torque will cause damage to the tool holder (and collet if applicable).

ROTARY WIPER makes it possible to view the production/machining process clearly within the machine enclosure. The window will get dirty from oils, coolants and chips. By installing ROTARY WIPER, even large amount of coolants, etc., will not prevent an operator from being able to observe set-ups and production runs of all sorts.

- Improved Visible Area
- Less Air Consumption & Lower Noise Level
- Easier Maintenance Work
- Improved Sealing Performance against Coolant (For Tape Fitting Type)
- Special chemically treated glass provides long life from chips and debris
- Low Profile for tight installation areas

Version 2 Refined Design

This air driven rotary window does not require special wiring like competitive models. Installation could not be more simple:

1. Choose your mount type (Bolt or Tape)
Tape: Recommended Glass & Safety Glass
Bolt: For all other materials
 2. Install in machine per provided instructions
 3. Run Air Cable to the machine control side air bank
 4. Attached Air Cable to your Rotary Wiper
- Done!

If RW window was to become damaged, easy removal of the 4 screws from the center hub makes window replacement easy.

Rotary Wiper is available in 2 different mountings, Bolt & Tape. Bolt mountings require 8 mounting screw holes in the windows. Tape on uses a high end adhesive with the only requirement is a clean window.

PIONEER = Synonym of High Precision Air Chucks & Reliability

It holds workpiece soft and evenly to reduce the distortion when clamping, and perform the highest accuracy in turning and grinding. There are two basic models to meet the various applications different in the shape, material, hardness, mass, wall thickness of clamping part, spindle speed, and the accuracy required.

① Diaphragm Type High Precision Air Chuck

Soft & even contact to the workpiece for highest accuracy!

② Slide Jaw Type Precision Air Chuck

Variety of types for wide range of precision turning & grinding!
